

The Safe Public Places Act

Protecting the Public From Harmful Pesticides

The State of Oregon has a responsibility to protect the public by using safer alternatives to toxic pesticides on state public property.

Pesticides are a public and environmental health problem, linked to disease and environmental damage. That's why, in 2009, Oregon adopted a law to reduce toxic pesticides at all schools by using the industry standard: Integrated Pest Management, or IPM. The State of Oregon should do the same for all public places. If the schools can do it, so can state agencies, office buildings and parks.

The proposed IPM policy for the State of Oregon applies only to public property, not to private land. It requires the State to adopt a health-based standard when managing pests, such as insects and weeds, by considering least toxic methods first, and using pesticides only when necessary to get the job done.

IPM is a science-based, proven approach to protect our health, preserve the environment and ensure our rivers continue to support salmon and provide safe drinking water. IPM would also help us meet our state's pollution reduction goals and help Oregon remain a national leader in environmental policies.

By supporting this State of Oregon IPM policy, you will help protect children and families who visit state buildings and parks and help keep nearly 200,000 State of Oregon employees healthier.

Integrated Pest Management will...

Protect Children's Health

Children are more susceptible to environmental hazards than adults. Pesticide exposure, even in small amounts, is especially harmful because a child's brain, nervous and reproductive systems are still growing. The EPA states: One of the most effective ways you can help prevent pesticide poisonings is by adopting Integrated Pest Management practices, a safer method of pest management. Families deserve to know that Oregon is dedicated to protecting children by using only the safest and least toxic methods of pest management.

Save Oregon Money

IPM methods save money by increasing efficiency and removing duplicative programs. The latest research shows that using IPM is a more effective long-term form of pest management.

Protect the Environment

Reducing the amount of toxic pesticides on public property will keep thousands of gallons of chemical runoff from contaminating Oregon's rivers, soils and air. It's the responsible option for our citizens, our wildlife and our water.
